MobIoT

Middleware for the Large-scale Internet of Mobile Things that handles the large number of active mobile devices by preventing redundant ones from registering their services.

**Technological barrier:** Support the development of IoT applications based on knowledge about the real world.

Handle a large number (billions) of mobile devices based on probabilistic models.

**Possible fields of application:** participatory mobile sensing, IoT applications.

**Language, environment:** Java, Android

**Keywords:** mobile Internet of Things

**License:** LGPL, Dual License

**Academic partners**
